

# Digital Transformation through Low-Code Technology

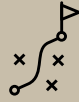

To compete within turbulent markets, businesses need to innovate faster. One of the tools that can allow organizations to deliver innovation at scale is Low-Code technology. Low-Code is an approach to develop software with minimal hand-coding and often done through a Low-Code Development Platform. These tools abstract the complexity of traditional software development and enable organizations to rapidly prototype and deliver; to focus on building solutions that meet their business needs.

## Answering the Build vs Buy Dilemma.

When choosing a digital solution, organizations often come across the dilemma of whether to build their own custom software or look for a packaged solution. Packaged solutions offer pre-made configurations and templates allowing faster time to market but may not address all use-cases. On the other hand, custom development allows organizations to tailor the solution to their business needs but sacrifices on time and cost. Low-Code solutions offer the benefits of both options: a packaged software that enables you to customize and build your application as you designed it.

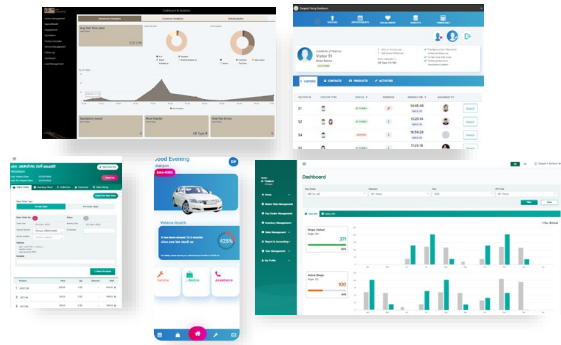

## ABeam Consulting offers 3 different types of services related to Low-Code Digital Transformation

 <p><b>Custom Application Development</b></p> <p>Developing custom web and mobile applications using the OutSystems low-code platform. Integrate solutions with core systems or build it as a standalone application.</p>	 <p><b>Application Roadmap Design</b></p> <p>Designing an IT roadmap for your applications for effective use of your low-code platforms.</p>	 <p><b>Governance &amp; Architectural Design Training</b></p> <p>Enabling your IT resources to effectively low-code strategy through development best practices and template governance patterns.</p>

## OutSystems, the leading multi-experience low-code development platform

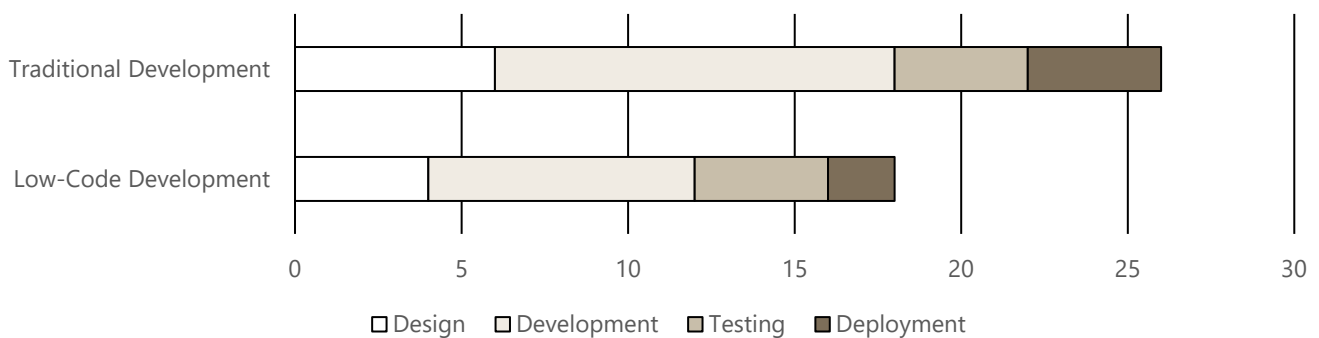

ABeam Consulting (Thailand) has partnered with OutSystems to offer low-code digital transformation services. With OutSystems, organizations can develop web and mobile applications to tackle almost every enterprise business use-cases.

### Focus on building faster and better

OutSystems as a low-code tool allow developers to embody the agile principles – with built-in documentation and collaboration tools. Developers can focus on delivering value by deploying a working product for iterative feedback and improvements. This results in shorter time to market, but also better-quality software as compared to traditional development.

Development Timeline (weeks) between Low-Code vs Traditional Development

**Notes:**

Average comparative project estimates when proposing custom development through traditional vs low-code. Actual project timeline is dependent on scope and size of the application.

### Let ABeam Consulting be your partner in your digital transformation journey
